---

## Summary

Senior Software Engineer at Woolworths Group with 5+ years' experience across the full SDLC in agile environments. Specializes in service architecture, domain-driven design, and observability, with recent focus on leading technical workstreams for a major platform transition. Strong communicator who builds documentation, tooling, and cross-team processes that scale beyond a single project.

## Experience

### Senior Software Engineer — Woolworths Group, Sydney, Australia

*January 2026 – Present*

- Raised coding standards and TDD practices to a blueprint now adopted by other teams for scalable, maintainable brownfield development.
- Led an observability tooling uplift ahead of a platform vendor transition, completing rollout two weeks ahead of schedule, including playbooks, dashboards, and team training.
- Served as Change Owner for deployment releases, becoming a central point of reference for support teams.
- Drove migration of repositories to a modern source control platform to adopt AI-assisted coding and automated dependency management tools, and hosted workshops to build team-wide AI tooling awareness.
- Delivered technical feasibility analysis and contributed to the high-level design and proof-of-concept for a major platform migration, including a critical data integration phase.
- Strengthened cross-team alignment through proactive written escalation with reliability, delivery, and centre-of-excellence teams to unblock work and meet deadlines.

### Software Engineer — Woolworths Group, Sydney, Australia

*April 2024 – January 2026*

- Led the architectural revamp of a core scheduling service, redesigning it into a streamlined microservice architecture focused on pure request transformation.
- Proposed and drove adoption of a serverless, event-driven design for a customer prioritization service, resolving cross-domain violations and improving system monitorability.
- Applied SOLID principles, Domain-Driven Design, and TPL Dataflow to mature an order-management service's orchestrator-based architecture.
- Built a BDD framework for functional testing and separated unit/component test layers, strengthening the team's TDD capability.
- Created a foundational inner-sourcing framework and documentation, reducing onboarding time and cutting reliance on tribal knowledge.

- Took ownership of on-call and alert triage; led root-cause analysis and remediation for a critical service, resulting in a measurably more stable system and reduced alert noise.

### **Software Engineer** — Campaign Monitor, Sydney, Australia

*January 2021 – March 2024*

- Owned technical vision and direction at the team level, taking accountability for architecture and implementation decisions.
- Translated business requirements into technical solutions and communicated trade-offs clearly to both engineering and non-technical stakeholders.
- Surfaced and resolved low-level and conceptual issues during code review, raising the team's overall code quality.
- Mentored an intern over a 6-month placement on career growth and technical skills.
- Member of a peer working group focused on front-end standards: wrote semantic HTML and advanced CSS, reviewed peers' UI work, and presented on best practices at team meetings.

## Education

### **Bachelor of Computer Science, Distinction Average**

University of New South Wales — 2017–2020

## Skills

- **Programming Languages:** C#, .NET, React, TypeScript, HTML/CSS, SQL
- **Architecture & Practices:** Domain-Driven Design, Microservices, TDD/BDD, TPL Dataflow
- **Technologies & Tools:** AWS, Docker, Kafka, GitHub, GitHub Copilot, Dependabot, Dynatrace, TeamCity, Jira
- **Leadership & Communication:** Cross-functional stakeholder communication, mentoring, technical writing & documentation, code review facilitation

## Interests

HTML/CSS best practices · Functional programming · Bouldering
